

Stakeholder Insights & Performance Dashboard

Detailed Tableau Dashboard Analysis Report

Purpose: This report documents the structure, KPIs, visual analysis, business interpretation, technical design, and limitations of the supplied Tableau dashboard.

1. Executive Summary

The dashboard is an interactive stakeholder-performance view built in Tableau. It combines KPI cards, categorical comparisons, time-based analysis, city/tenure profitability, asset-under-management comparisons, shareholding distribution, and cost/profitability visuals into a single management-style interface.

At the displayed default filter state, the headline KPIs are 245.9B Total Premium, 34.5 Average Age of Stakeholders, 230.8B Equity Value Created, and 49.2M Highest Value Created by Insurer. These values provide a high-level snapshot before users drill down through the filters.

2. Project Objectives

- Provide a single interactive view of stakeholder and financial performance.
- Compare value creation across insurer categories.
- Track premium-related activity over time.
- Analyze profitability by city and policy tenure.
- Compare assets under management across stakeholder groups.
- Visualize shareholding composition.

- Compare cost-ratio categories with profitability-related measures.
- Enable interactive segmentation through dashboard filters.

3. Data Source & Technical Structure

The Tableau workbook uses a data source named Finance Sheet (Finance record), with the underlying table identified as Finance Sheet. The workbook metadata shows an Excel source named Finance record.xlsx and fields including ID, Stakeholder, Insurer, Value Created, Shareholding Pattern, City, Brokers, Premium, Date, Premium 1, Profitability, Cost Ratio, Assets under Management, Educational Qualifications, People, Policy Tenure, Gender, and Age.

The supplied packaged workbook contains the Tableau workbook definition and a bank-logo image, but the original Excel source file is referenced through a local Mac path. Therefore, for GitHub sharing, the source workbook should either be packaged correctly into the Tableau file, replaced with a Tableau extract, or separately included if it is permitted to share the underlying data.

4. Dashboard Filters

Filter	Purpose
Gender	Segment the dashboard by stakeholder gender.
MY(Date)	Filter the displayed analysis by month/year date values.
Premium	Filter records according to premium-related categories/values.
Stakeholder	Focus analysis on selected stakeholder categories.
Assets under management	Segment the analysis by AUM category.
City	Focus on selected cities.
Profitability	Filter the dashboard by profitability category.

5. KPI Analysis

KPI	Displayed Value	Interpretation
Total Premium	245.9B	Headline premium value shown in the dashboard.
Average Age of Stakeholders	34.5	Average stakeholder age under the current dashboard context.
Equity Value Created	230.8B	Headline equity/value-creation indicator.
Highest Value Created by Insurer	49.2M	Highest insurer-level value shown by the KPI card.

6. Visual-by-Visual Analysis

6.1 Value Created by Insurers

The bar chart ranks insurer categories by value created. The displayed values are approximately 139.9B for Bancassurance partners, 61.0B for Partner branches, 33.8B for Broker, 7.8B for Corporate agent, 2.9B for Employee, and 0.5B for Lives cover. The workbook sorts insurer categories in descending order of the Sum of Value Created, making the largest contributors immediately visible.

6.2 Premium Over Time

The time view presents yearly bars from 2014 through 2024. The Tableau workbook uses a count of the field 'Premium 1' by year rather than a direct sum of the Premium measure. This is important when interpreting the chart: it behaves as a record/count trend unless the underlying Premium 1 field has a business-specific encoding. The visible labels show higher activity around the middle of the displayed period and a much smaller bar in 2024.

6.3 Profitability by City and Tenure

This view compares cities such as Ahmedabad, Bangalore, Goa, Jamshedpur, Jhalna, Mangalore, Mumbai, Mysure, and Pune against tenure buckets: less than 1 year, 1 to 3 years, 3 to 5 years, and more than 5 years. The visual makes it possible to identify where profitability is concentrated and whether longer or shorter tenure groups contribute more strongly.

6.4 Asset Under Management by Stakeholder

The chart compares People, Distributors, Customers, Investors, Community, Environment, and Premium. People is the dominant displayed category at approximately 5,024, followed by Customers at about 924, Investors at 917, Community at 902, Environment at 760, and Distributors at about 693. The displayed values should be interpreted according to the underlying AUM field definition.

6.5 Shareholding Distribution

The donut chart shows the shareholding mix among DII, FII, Promoters, and Retail. The displayed proportions are approximately FII 38.4%, DII 30.2%, Promoters 28.2%, and Retail 3.3%. The distribution indicates that institutional categories account for the largest combined share in the displayed dashboard state.

6.6 Cost Ratio vs Profitability

The lower-right chart compares cost-ratio categories across two profitability contexts: Net worth and Profit after tax. The displayed values include 191.2B for Opex under Net worth, 20.4B for Commission ratio under Profit after tax, 22.7B for Opex under Profit after tax, and 11.6B for Total cost ratio. The chart is useful for comparing relative magnitudes, although the underlying categorical field design should be documented before using these values as formal financial ratios.

7. Major Insights

- Bancassurance partners are the largest displayed contributor to value created, substantially ahead of the other insurer categories.
- Partner branches and brokers are the next major contributors, indicating a concentrated value-creation structure.
- The shareholding distribution is led by FII and DII, while Retail has the smallest displayed share.
- People is the largest displayed stakeholder/AUM category, showing a strong concentration relative to the other categories.
- The city-and-tenure view demonstrates that profitability is not uniform across locations or tenure groups; some city/tenure combinations stand out strongly.
- The time-based premium view provides historical visibility, but its use of a count of Premium 1 means it should not automatically be described as total premium revenue without validating the field definition.
- The dashboard is designed for interactive segmentation, so the headline figures can change when filters are applied.

8. Business Interpretation

From a management perspective, the dashboard can be used to identify high-value distribution channels, monitor stakeholder composition, investigate regional profitability differences, and understand the relative importance of stakeholder groups. The insurer-value chart can support channel prioritization, while the city/tenure matrix can help identify segments requiring deeper investigation. The shareholding chart provides a concise ownership-structure view, and the cost/profitability chart can be used as a starting point for efficiency analysis.

9. Data & Dashboard Quality Review

- The dashboard has a clear executive layout with KPI cards at the top and detailed analysis underneath.
- The filter panel is consistently positioned on the left, supporting interactive exploration.
- The dashboard uses consistent blue branding and strong section headers, giving it a professional banking/finance appearance.
- Several field names in the workbook contain spelling issues such as 'Shareholding pattern', 'Policy tender', and 'Mysure'. These should be corrected if the source data can be edited.
- The Premium Over Time sheet counts 'Premium 1' rather than summing a numeric premium field. The business definition should be validated before presenting it as premium amount.
- The Cost Ratio field is stored as a string/categorical dimension in the workbook metadata. If it represents actual ratios, converting it to a numeric measure would make analytical interpretation stronger.
- The packaged workbook references a local Excel path. For GitHub distribution, portability should be tested on another computer.

10. Recommendations for Improvement

- Rename and standardize fields: correct spelling and use business-friendly field names.
- Validate the Premium Over Time calculation and, if appropriate, use SUM(Premium) instead of COUNT(Premium 1).
- Convert numeric financial fields stored as strings into proper numeric measures.
- Add a clear date-range indicator showing the currently selected period.
- Add tooltips explaining units such as B, M, and percentage values.
- Consider adding a trend KPI such as YoY growth in premium or value created.
- Add a Top-N insurer/channel selector if the underlying data contains many categories.
- Add a clear 'Reset Filters' button to improve usability.
- If the workbook is intended for portfolio use, test the dashboard in Tableau Public or another shareable environment.
- Package or separately provide the data source in a privacy-safe manner so the workbook can be opened by recruiters.

11. GitHub Portfolio Documentation

For GitHub, the recommended repository should contain the Tableau packaged workbook, a dashboard preview image, and a README explaining the objective, KPIs, charts, tools, insights, and instructions for opening the workbook. Do not publish confidential customer, financial, or company data without permission. If the underlying Excel file contains sensitive information, replace it with a sanitized/sample dataset or use an approved Tableau extract.

12. Conclusion

The Stakeholder Insights & Performance Dashboard provides a strong foundation for a Data Analyst/Business Intelligence portfolio project. It demonstrates practical Tableau skills including KPI design, categorical comparison, time analysis, segmentation, dashboard filtering, financial visualization, and executive-style presentation. The strongest portfolio improvements would be validating the metric definitions, correcting data-field naming, ensuring the workbook is portable, and documenting the business insights clearly.

Prepared from: Supplied Tableau packaged workbook and dashboard preview. Values and interpretations reflect the dashboard's displayed/default state and workbook metadata.
